   PUBMED   1317301
COMMENT     The authors changed locus name to SCN1A according to the consensus
            nomenclature. This gene is abbreviated as HBSC I for human brain
            sodiumchannel I in reference [3] (FEBS Lett., 303:53-58 1992).

            Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It

                     NIH_BMAP_M_S4 library is a subtracted library of a series,
                     ultimately derived from a mixture of individually tagged
                     normalized libraries from ten regions of the mouse brain
                     (cerebellum, brain stems, olfactory bulbs, hypothalamus,
                     cortex, amygdala, basal ganglia, pineal gland, striatum,
                     hipoccampus) after a series of subtractions to reduce the
                     representation of cDNAs from which ESTs had already been
                     generated. The following serially subtracted libraries
                     were generated in this process: NIH_BMAP_M_S4,
                     NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.1,
                     NIH_BMAP_M_S2, NIH_BMAP_M_S1. The subtracted library
                     (NIH_BMAP_M_S4) was constructed as follows: PCRamplified
                     cDNA inserts from NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, and
                     NIH_BMAP_M_S3.1 clones from which 3' ESTs had been derived
                     was used as a driver in a hybridization with a pool of
                     the NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, and NIH_BMAP_M_S3.1
                     libraries in the form of single-stranded circles. The
                     remaining single-stranded circles (subtracted library)
                     was purified by hydroxyapatite column chromatography,
                     converted to double-stranded circles and electroporated
                     into DH10B bacteria (LifeTechnologies) to generate the
                     NIH_BMAP_M_S4 library. This procedure has been previously
                     described (Bonaldo, Lennon and Soares, Genome Research

            The sequence contained an oligo-dT track that was present in the
            oligonucleotide that was used to prime the synthesis of first
            strand cDNA and therefore this may represent a bonafide poly A
            tail. The sequence tag present in the cDNA between the NotI site
            and the oligo-dT track served to identify it as a clone from the

            Soares Lab Clone distribution: NIH BMAP cDNA clones will be made
            available by the means that is soon to be determined. When NIH

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

HUMHBAX

LOCUS	HUMHBAX	6328 bp mRNA linear PRI 09-JUN-1994
DEFINITION	Human voltage-gated sodium channel mRNA, complete cds.	
ACCESSION	M94055	
VERSION	M94055.1 GI:456678	
KEYWORDS	sodium channel alpha subunit; voltage-sensitive sodium channel.	
SOURCE	Homo sapiens cDNA to mRNA.	
ORGANISM	Homo sapiens	
	Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.	
REFERENCE	1 (bases 1 to 6328)	
AUTHORS	Ahmed,C.M., Ware,D.H., Lee,S.C., Patten,C.D., Ferrer-Montiel,A.V., Schinder,A.F., McPherson,J.D., Wagner-McPherson,C.B., Wasmuth,J.J., Evans,G.A. and Montal,M.	
TITLE	Primary structure, chromosomal localization, and functional expression of a voltage-gated sodium channel from human brain	
JOURNAL	Proc. Natl. Acad. Sci. U.S.A. 89 (17), 8220-8224 (1992)	
MEDLINE	92390418	
PUBMED	1325650	
REFERENCE	2 (bases 1 to 6328)	
AUTHORS	Sun,W.	
TITLE	Direct Submission	
JOURNAL	Submitted (06-OCT-1992) William Sun, Biology Department, 9500 Gilman Drive, University of California, San Diego, La Jolla, CA 92093-0357, USA	
COMMENT	On Feb 25, 1994 this sequence version replaced gi:183806.

CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

PT   New human transporters and ion channels (TRICH) polypeptides useful for
PT   diagnosing, treating or preventing disorders associated with aberrant
PT   expression of TRICH  -
XX
PS   Claim 11; Page 196-197; 210pp; English.
XX
CC   The invention relates to human transporters and ion channels (TRICH)
CC   polypeptides and their cDNA molecules. The nucleic acid and polypeptide
CC   sequences are useful in the diagnosis, treatment, and prevention of
CC   disorders associated with transport (akinesia, cystic fibrosis, Bell's
CC   palsy, amyotrophic lateral sclerosis); neurological (Alzheimer's disease,
CC   amnesia, dementia); muscle (cardiomyopathy, myocarditis, Duchenne's
CC   muscular dystrophy); immunological (AIDS, Addison's disease, allergies,
CC   asthma); cell proliferative disorders (cancers, leukaemia, psoriasis);
CC   cardiac disease (angina, hypertension, or bradyarrythmia) and in the
CC   assessment of the effects of exogenous compounds on the expression of
CC   nucleic acid and amino acid sequences of transporters and ion channels.
CC   The polynucleotides may be used to detect and quantify gene expression
CC   in biopsied tissues in which TRICH expression may be correlated with a
CC   disease, to generate hybridization probes for mapping naturally occurring
CC   genomic sequence, and in drug screening. The present sequence is human
CC   TRICH-13 cDNA.

CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The
CC method comprises determining the genotype of at least one gene selected
CC from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC sodium channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome
CC 2q23-q31. Compounds identified as modulators of the biological activity
CC of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC epilepsy or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC primers, oligonucleotides and proteins given in the exemplification of
CC the present invention.

PS Claim 1; Page 28-30; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

XX
CC   The present invention describes human sodium channels SCN1A and SCN3A.
CC   The present sequence encodes the human sodium channel SCN1A. SCN1A and
CC   SCN3A have been located to the human chromosome 2 long arm, positions
CC   2q24 and 2q24-31 respectively. The sodium channel proteins are useful
CC   in studying the physiological mechanism in which excitant cells
CC   participate and cause human diseases, and in developing remedies for
CC   e.g. familial hypercalcaemic periodic paralysis of extremities and
CC   motor endplate disease.

XX
PS   Claim 1; Page 62-64; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
PS   Claim 1; Page 35-36; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion channel protein. NHP share structural similarity with mammalian sodium channel proteins particularly voltage-gated sodium channel proteins. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NHP gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice sites, introns that can be used in diagnostics and pharmacogenomics. NHP nucleotide sequences are useful for drug screening effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body, and nucleotide constructs encoding NHP products are useful to genetically engineer host cells to express NHP products in vivo. These genetically engineered cells function as bioreactors in the body delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion protein to the body. Nucleotide construct encoding NHP products are also useful in gene therapy for modulating NHP expression and to produce genetically engineered host cells to express NHP products in vivo. NHP nucleotide sequences may also be used as part of ribozyme and/or triple helix sequences that are useful for NHP gene regulation. The NHP polypeptides are useful for generating antibodies, as reagents in diagnostic assays, for identifying other cellular gene products related to NHP and as reagents in assays for screening for compounds that are useful in the treatment of mental, biological or medical disorders and diseases.

PS   Claim 1; Page 41-42; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The
CC method comprises determining the genotype of at least one gene selected
CC from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC sodium channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome
CC 2q23-q31. Compounds identified as modulators of the biological activity
CC of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC epilepsy or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC primers, oligonucleotides and proteins given in the exemplification of
CC the present invention.

```
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

PS Claim 1; Page 46-47; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect

```
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

PS Claim 1; Page 78-79; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov
Series: IRAK Plate: 48 Row: h Column: 9
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 10337596
This clone has the following problem: frame shifted.

                     UI-E-EJ1 is a subtracted cDNA library constructed
                     according to Bonaldo, Lennon and Soares, Genome Research,
                     6:791-806, 1996. First strand cDNA synthesis was primed
                     with an oligo-dT primer containing a Not I site. Double
                     stranded cDNA was ligated to an EcoR I adaptor, digested
                     with Not I, and cloned directionally into pT7T3-Pac
                     vector. The oligonucleotide used to prime the synthesis of
                     first-strand cDNA contains a library tag sequence that is
                     located between the Not I site and the (dT)18 tail. The
                     sequence tags for this library are: fetal eyes, AGAATCAAGA
                     ; lens, CGATTAGCGA; eye anterior segment, AATGCCGCAT;
                     optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and
                     Macular, GTCC; RPE and Choroid, ACCTA. This library was
                     created for the program, Gene Discovery in the Visual
                     System, supported by National Eye Institute (NEI)."

First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes, AGAATCAAGA ; lens, CGATTAGCGA; eye anterior segment, AATGCCGCAT; optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer Research Center (DKFZ); Email s.wiemann@dkfz- heidelberg.de;
sequenced by EMBL (European Molecular Biology Laboratories, Heidelberg/Germany) within the cDNA sequencing consortium of the German Genome Project.
No s1 sequence available.
This clone (DKFZp686H1140) is available at the RZPD in Berlin.

/note="Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; The NIH_BMAP_M_S4 library is a subtracted library of a series, ultimately derived from a mixture of individually tagged normalized libraries from ten regions of the mouse brain (cerebellum, brain stems, olfactory bulbs, hypothalamus, cortex, amygdala, basal ganglia, pineal gland, striatum, hipoccampus) after a series of subtractions to reduce the representation of cDNAs from which ESTs had already been generated. The following serially subtracted libraries were generated in this process: NIH_BMAP_M_S4, NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.1, NIH_BMAP_M_S2, NIH_BMAP_M_S1. The subtracted library (NIH_BMAP_M_S4) was constructed as follows: PCRamplified cDNA inserts from NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, and NIH_BMAP_M_S3.1 clones from which 3' ESTs had been derived was used as a driver in a hybridization with a pool of the NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, and NIH_BMAP_M_S3.1 libraries in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (LifeTechnologies) to generate the NIH_BMAP_M_S4 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:791-806, 1996)"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

; GENERAL INFORMATION:
; APPLICANT: Mandel, Gail
; APPLICANT: Halegoua, Simon
; APPLICANT: Borden, Laurence A.
; TITLE OF INVENTION: Peripheral Nervous System Specific
; TITLE OF INVENTION: Sodium Channels, DNA Encoding Therefor, Crystallization,
; TITLE OF INVENTION: X-ray Diffraction, Computer Molecular Modeling, Rational
; TITLE OF INVENTION: Drug Design, Drug Screening, and Methods of Making and Usi
; TITLE OF INVENTION: Thereof

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

            ----------

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. John D.
            McPherson, Department of Genetics, Washington University, St. Louis
            MO.  For additional information about the map position of this
            sequence, see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            The RPCI-11 human BAC library was made from the blood of one male
            donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
            Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
            approach for construction of bacterial artificial chromosome
            libraries.  Genomics 51:1-8.  The clone may be obtained either from
            Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
            and coworkers at the Roswell Park Cancer Institute
            (http://bacpac.med.buffalo.edu)
            VECTOR:  pBACe3.6
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RP11-467P13; the clone sequenced
            to the right is AP001199.  Actual start of this clone is at base
            position 1 of RP11-2I8; actual end is at base position 190066 of
            RP11-2I8.

            The sequence RP11-2I8 between bases 157391 to 157436 was derived
            from a single plasmid subclone sequenced only on one strand.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

PT   New human transporters and ion channels (TRICH) polypeptides useful for
PT   diagnosing, treating or preventing disorders associated with aberrant
PT   expression of TRICH -
XX
PS   Claim 11; Page 196-197; 210pp; English.
XX
CC   The invention relates to human transporters and ion channels (TRICH)
CC   polypeptides and their cDNA molecules. The nucleic acid and polypeptide
CC   sequences are useful in the diagnosis, treatment, and prevention of
CC   disorders associated with transport (akinesia, cystic fibrosis, Bell's
CC   palsy, amyotrophic lateral sclerosis); neurological (Alzheimer's disease,
CC   amnesia, dementia); muscle (cardiomyopathy, myocarditis, Duchenne's
CC   muscular dystrophy); immunological (AIDS, Addison's disease, allergies,
CC   asthma); cell proliferative disorders (cancers, leukaemia, psoriasis);
CC   cardiac disease (angina, hypertension, or bradyarrythmia) and in the
CC   assessment of the effects of exogenous compounds on the expression of
CC   nucleic acid and amino acid sequences of transporters and ion channels.
CC   The polynucleotides may be used to detect and quantify gene expression
```

```
CC   in biopsied tissues in which TRICH expression may be correlated with a
CC   disease, to generate hybridization probes for mapping naturally occurring
CC   genomic sequence, and in drug screening. The present sequence is human
CC   TRICH-13 cDNA.

CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The
CC method comprises determining the genotype of at least one gene selected
CC from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC sodium channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome
CC 2q23-q31. Compounds identified as modulators of the biological activity
CC of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC epilepsy or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC primers, oligonucleotides and proteins given in the exemplification of
CC the present invention.

CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The
CC method comprises determining the genotype of at least one gene selected
CC from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC sodium channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome
CC 2q23-q31. Compounds identified as modulators of the biological activity
CC of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC epilepsy or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC primers, oligonucleotides and proteins given in the exemplification of
CC the present invention.

PS Claim 1; Page 69-70; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

PS Claim 1; Page 73-75; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

PS Claim 1; Page 78-79; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

PT   Novel polynucleotides encoding human sodium channel proteins,
PT   particularly voltage-gated sodium channel proteins useful for drug
PT   screening, diagnosis and in gene therapy of biological disorders -
XX
PS   Claim 1; Page 28-30; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

PT   Novel polynucleotides encoding human sodium channel proteins,
PT   particularly voltage-gated sodium channel proteins useful for drug
PT   screening, diagnosis and in gene therapy of biological disorders -
XX
PS   Claim 1; Page 35-36; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
CC The present invention describes human sodium channels SCN1A and SCN3A.
CC The present sequence encodes the human sodium channel SCN1A. SCN1A and
CC SCN3A have been located to the human chromosome 2 long arm, positions
CC 2q24 and 2q24-31 respectively. The sodium channel proteins are useful
CC in studying the physiological mechanism in which excitant cells
CC participate and cause human diseases, and in developing remedies for
CC e.g. familial hypercalcaemic periodic paralysis of extremities and
CC motor endplate disease.

XX
PS   Claim 1; Page 41-42; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

PS Claim 1; Page 46-47; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in

CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

PT   Novel polynucleotides encoding human sodium channel proteins,
PT   particularly voltage-gated sodium channel proteins useful for drug
PT   screening, diagnosis and in gene therapy of biological disorders
XX
PS   Claim 1; Page 51-52; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

CC The present invention provides a number of single exon nucleic acid
CC probes which are derived from genomic sequences expressed in the human
CC brain. They can be used to measure gene expression in brain cell samples,
CC which may enable the diagnosis and improved treatment of nervous system
CC diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
CC epilepsy and cancers. The present sequence is one of the probes of the
CC invention.

                     UI-E-EJ0 is a subtracted cDNA library constructed
                     according to Bonaldo, Lennon and Soares, Genome Research,
                     6:791-806, 1996. First strand cDNA synthesis was primed
                     with an oligo-dT primer containing a Not I site. Double
                     stranded cDNA was ligated to an EcoR I adaptor, digested
                     with Not I, and cloned directionally into pT7T3-Pac
                     vector. The oligonucleotide used to prime the synthesis of
                     first-strand cDNA contains a library tag sequence that is
                     located between the Not I site and the (dT)18 tail. The
                     sequence tags for this library are: fetal eyes, AGAATCAAGA
                     ; lens, CGATTAGCGA; eye anterior segment, AATGCCGCAT;
                     optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and
                     Macular, GTCC; RPE and Choroid, ACCTA. This library was
                     created for the program, Gene Discovery in the Visual
                     System, supported by National Eye Institute (NEI)."
